

IN THE CLAIMS

Please amend the following claims which are pending in the present application:

- 1- 19. (Cancelled)
20. (Previously presented) A processing system comprising:
a mold chase including a profile that is capable of causing molding cap compound to originate on a die at a die height that is substantially above the die active surface and below the die backside second surface, and that forms a third surface that is substantially parallel planar to the die backside second surface.
21. (Original) The processing system according to claim 20, wherein the profile is capable of forming a meniscus where the molding cap compound originates, wherein the meniscus is formed as one selected from a capillary action meniscus and an imposed meniscus.
22. (Original) The processing system according to claim 20, wherein the profile is capable of imposing an exposed upper surface upon a mounting substrate at a position between a first die cavity in the mold chase and a second die cavity in the mold chase.

23. (Original) The processing system according to claim 20, wherein the profile includes a first die cavity, a second die cavity contiguous the first die cavity, and a last die cavity contiguous the first die cavity,
wherein the first die cavity, the second die cavity, and the last die cavity are arranged in a configuration selected from:
the first die cavity, the second die cavity, and the last die cavity are disposed in a single molding compound cap cavity;
the first die cavity, the second die cavity, and the last die cavity are each disposed in separate molding compound cap cavities;
the first die cavity and the second die cavity are disposed in a single molding compound cap cavity, and at least two occurrences of the last die cavity are disposed in a single molding compound cap cavity; and
the first die cavity and the second die cavity are each disposed in separate molding compound cap cavities, and at least two occurrences of the last die are disposed in a single molding compound cap cavity.

24. (Previously presented) A process comprising:
forming a molding compound cap over a first die that is disposed upon a substrate, wherein the first die includes a first die active first surface and a first

die backside second surface, and wherein forming the molding compound cap includes forming a molding compound cap third surface that is parallel planar and above the first die active first surface and below the first die backside second surface, and wherein the molding compound cap third surface includes:

a meniscus that originates substantially above the first die active first surface, wherein the meniscus is an imposed meniscus or a capillary action meniscus; and

a substantially planar surface that is parallel planar to the first die active first surface, and parallel planar located above the first die active first surface at a height that is a fraction of the die height.

25. (Cancelled)

26. (Previously presented) The process according to claim 24, further including:

forming the molding compound cap over a second die that is disposed upon the mounting substrate, wherein the second die includes a second die active first surface and a second die backside second surface, and wherein forming the molding compound cap includes forming the molding compound cap third surface parallel planar and above the second die active first surface and

below the second die backside second surface.

27. (Original) The process according to claim 24, further including:

forming the molding compound cap over a last die that is disposed upon the mounting substrate, wherein the last die includes a last die active first surface and a last die backside second surface, and wherein forming the molding compound cap includes forming the molding compound cap third surface above the last die active first surface and below the last die backside second surface.

28. (Original) The process according to claim 24, wherein forming the

molding compound cap includes injection molding the molding compound with a particulate.

29. (Original) The process according to claim 24, further including:

forming the molding compound cap over a second die that is disposed upon the mounting substrate, wherein the second die includes a second die active first surface and a second die backside second surface, and wherein forming the molding compound cap includes forming the molding compound cap third surface above the second die active first surface and below the second die backside second surface; and

forming the molding compound cap over a last die that is disposed upon the mounting substrate, wherein the last die includes a last die active first surface and a last die backside second surface, and wherein forming the molding compound cap includes forming the molding compound cap third surface above the last die active first surface and below the last die backside second surface.

30. (Original) The process according to claim 24, wherein forming the molding compound cap is selected from injection molding, *in situ* thermal curing, pick-and-place coupling the molding compound cap with the first die, and combinations thereof.
